

ARC LES

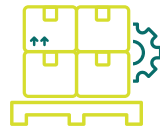

Proven Solution for Warehouse Operations

CHALLENGES:

Warehouse management has always been a challenge for pharmaceutical companies because of the manual work required and the hardware restrictions for post-packaging order reprocessing. Newly introduced regulations such as aggregation only makes this challenge harder due to weak integrations with Level 2, Level 4, ERP and centralized label management solutions of the existing solutions on the market.

SOLUTION:

ARC LES is the operating system of the warehouse and packaging shop-floor operations, including rework-after-serialization and shipment management, to increase inventory management efficiency.

ARC|LES

FEATURES:

- **Inbound - Goods Receipts & Returns operations:** ARC LES integrates with the contract partners in order to accept goods automatically, or after manual label scanner checks, which is especially useful for returns and goods receipts.
- **Outbound - Shipment operations:** ARC LES controls delivery operations from pallet level down to the individual serialized items and integrates with ARC MES/Cockpit to transmit details to the delivery partner
- **Rework operations:** ARC LES changes status or aggregation hierarchy after the packaging processes
- **Low Volume Serialization operations:** ARC LES checks the readability of the pre-printed labels and changes the item status to "good".

ARC Mobile

ARC Workstation

BENEFITS:

ARC LES operations can be executed with the **ARC workstation** and **ARC mobile**

Custom integrations with trading partners, 3PLs, CMOs, MAHs

Allow **rework operations** without involving a packaging line

Highly flexible centralized label management functionalities and integration with central label management solutions

Integration with a wide selection of **label printing technologies**

Able to **follow the new requirements** for warehouse operations or new regulations (e.g., aggregation, cold chain, verifications)
